Elign Gear Couplings

Flexible Couplings
CEL-2.00GB0312

PRODUCTS IN THE RANGE

Serving an entire spectrum of mechanical drive applications from food, energy, mining and metal; to automotive, aerospace and marine propulsion, we are here to make a positive difference to the supply of drive solutions.

Series A
Worm Gear units
and geared motors
in single & double
reduction types

Series BD
Screwjack worm
gear unit

Series BS
Worm gear unit

Series C
Right angle drive
helical worm geared
motors & reducers

Series F
Parallel angle helical
bevel helical geared
motors & reducers

Series G
Helical parallel shaft
& bevel helical right
angle drive gear
units

Series H
Large helical parallel
shaft & bevel helical
right angle drive units

Series J
Shaft mounted
helical speed
reducers

Series K
Right angle helical
bevel helical geared
motors & reducers

Series M
In-line helical geared
motors & reducers

Roloid Gear Pump
Lubrication and fluid
transportation pump

**Series X
Cone Ring**
Pin and bush
elastomer coupling

**Series X
Gear**
Torsionally rigid,
high torque coupling

**Series X
Grid**
Double flexing steel
grid coupling

**Series X
Nylicon**
Gear coupling with
nylon sleeve

**Series X
Torque Limiter**
Overload protection
device

We offer a wide range of repair services and many years experience of repairing demanding and highly critical transmissions in numerous industries.

We can create custom engineered transmission solutions of any size and configuration.

ELIGN COUPLINGS

INTRODUCTION

GEAR COUPLINGS

A Gear Coupling is used to join two rotating shafts for efficient transmission of mechanical power. Although the shafts are accurately aligned at the time of installation, it is likely that during the operation the alignment may get disturbed due to settling of foundation, thermal expansion, shaft deflection, wearing out of other parts, improper maintenance and many more reasons. Due to this unavoidable misalignment occurring during the operation a gear coupling provides a better solution to compensate or minimise the effect of misalignment. The gear Couplings are therefore ideally suited for wide range of application in the entire field of drive technology.

MISALIGNMENT

The main function of any Gear coupling is not only to connect two rotating shafts but also to accommodate misalignments of the connecting shafts ELIGN Gear coupling accommodates the following three types of misalignment.

A. Radial

When axes of connected shafts are parallel but not in the same straight line.

B. Angular

When axes of connected shafts intersect at the centre point of the coupling but not in the same straight line.

C. Combined radial and angular.

When the axes of connected shafts do not intersect at the point of the coupling and are not parallel.

FUNCTIONS

A

B

C

MISALIGNMENT

A

B

C

Besides the above three types of misalignment, the ELIGN Gear coupling range also permit axial movement of the shaft.

CAUTION.

Normally permissible angular misalignment of ELIGN gear coupling is 0.75 for each half. However, it does not mean that the misalignment should be permitted to this limit from the initial installation. Since misalignment can occur during operation the Elign gear coupling takes care of this without undue damage to the connected equipment. However the coupling's life may reduce due to relative motion between hub teeth and housing teeth causing increased wear on the teeth. It is therefore extremely important to align the interconnecting shafts precisely during initial installation.

FEATURES OF ELIGN COUPLINGS

ELIGN Gear coupling consists of hubs with multi crowned teeth at Flank, tip and chamfering on teeth.

Crowned Flanks: The flanks of the teeth are crowned so that the tooth thickness is greatest at that centre of the tooth. This ensures a larger contact area per tooth for higher torque requirements and puts more teeth in contact for the given angle. Actual tooth loading takes place near the centre of the tooth face where tooth thickness is greatest, Crowned flanks also eliminate end-of-tooth loading, provide optimal load distribution, and accommodate all types of misalignment with minimum backlash.

Crowned Tips: The tips of the teeth are crowned. The crowned tip contacts the root of the internal gear teeth in the external sleeve, accurately piloting the sleeve with true concentric ball-and-socket action. This allows minimum diametral sleeve clearance and centres the sleeve physically to ensure a good dynamic balance under various loading and misalignment conditions.

Crowned Chamfers: The faces of the teeth are adjacent to the tips and are chamfered to eliminate interference with the sleeve tooth fillets. This allows the true involute flanks of the gear teeth to be in contact with the sleeve teeth and ensures freedom to misalign.

The hub teeth are manufactured using the latest state of the art CNC machines. The hub is the heart of any gear coupling and a superior design and tooth profile of the hub enables the gear coupling to operate satisfactorily under all operating conditions with increased reliability and durability.

The multi crowned teeth also reduce the alignment adjustment and improve the load carrying capacity of the teeth. The backlash between the teeth is minimal due to the multi-crown tooth design a key feature for the Elign coupling range.

The ELIGN gear coupling is a simple, compact and light unit for transmitting the same power when compared to the couplings of similar capacity available in the market. It is manufactured out of tested quality forged carbon steel and passes through a number of quality checks. Each half of the ELIGN gear coupling is interchangeable with any of other half, of the same size of coupling.

ELIGN COUPLINGS

SELECTION INFORMATION

SELECTION

1. Obtain Shaft Sizes, compare shaft sizes of driving and driven equipment with listed maximum bores of desired series or type of coupling to determine "tentative" coupling size.

2. Compute effective kW/rpm or torque to be transmitted and select a service factor from the following tables.

$$\text{Determine kW/rpm (effective)} = \frac{\text{KW TRANSMITTED} \times \text{SERVICE FACTOR}}{\text{rpm}}$$

or determine Torque daNm

$$\text{Torque (effective) daNm} = \frac{955 \times \text{KW TRANSMITTED} \times \text{SERVICE FACTOR}}{\text{rpm}}$$

Confirm "Tentative" Coupling size or increase to a size which has a kW/rpm torque rating equal to or greater than the value created above.

3. Check the maximum speed of the application and refer to maximum speed ratings. These speeds are given only as a guide since the maximum speed depends on the application characteristics.

4. Check space limitations and the dimensions of the selected coupling should be compared with the space provided in the application to ensure proper clearances. Shaft extensions, separation, and clearances to align coupling should be checked.

Lifting Hole

The hubs of the couplings from size ED1600 upwards are supplied with lifting holes to allow for easy lifting of the coupling.

Lubrication

Each coupling half is provided with grease nipple/plug on the housing from where grease can be filled directly.

The couplings are supplied with some quality of grease to facilitate assembly. It is recommended to fill the required quality and quantity of grease before putting the coupling in operation.

Special Protection

All the components of the ELIGN gear couplings have a special rust preventative oil coating, in addition to all the nuts and bolts which are zinc/cadmium plated to further protect against rust & corrosion.

MECHANICAL RATINGS AND SERVICE FACTOR FM

Mechanical ratings measure capacity in terms of life and/or strength, assuming 10 hr/day continuous running under uniform load conditions.

Catalogue ratings allow 100% overload at starting, braking or momentarily during operation up to 10 hours per day.

The unit selected must therefore have a catalogue rating at least equal to half maximum overload.

Mechanical Service Factor Fm (Table 1) is used to modify the actual load according to daily operating time, and type of loading.

Load characteristics for a wide range of applications are detailed in Table 2 opposite, which are used in deciding the appropriate Service Factor Fm from Table 1.

If overloads can be calculated, or accurately assessed, actual loads should be used instead of Fm.

Prime mover	Duration of service hrs per day	Load classification-driven machine		
		Uniform mass acceleration factor < 0.2	Moderate mass acceleration factor < 3	Heavy mass acceleration factor < 10
Electric motor, steam turbine or hydraulic motor	Under 3	0.80	1.00	1.50
	3 to 10	1.00	1.25	1.75
	Over 10	1.25	1.50	2.00
Multi-cylinder internal combustion engine	Under 3	1.00	1.25	1.75
	3 to 10	1.25	1.50	2.00
	Over 10	1.50	1.75	2.25
Single cylinder internal combustion engine	Under 3	1.25	1.50	2.00
	3 to 10	1.50	1.75	2.25
	Over 10	1.75	2.00	2.50

ELIGN COUPLINGS

TYPES

TYPES OF ELIGN GEAR COUPLINGS

The following types are available

Type ED

Double Engagement

The couplings are available with bore limitations up to 540 mm and torque ratings up to 110,000 daNm

Type ER

Single Engagement

The couplings are available with bore limitations up to 370 mm one side and 410 mm on the rigid end and torque ratings up to 45,000 da Nm.

Type ET

Spacer Type

The couplings are available with bore limitations up to 540 mm and torque ratings up to 110,000 da Nm

Type EV

Vertical Type

The couplings are available with bore limitations up to 275 mm and torque ratings up to 17,400 da Nm

Type ES

Continuous Sleeve

The couplings are available with bore limitations from 40 mm to 275 mm and torque ratings from 1,600 da Nm up to 17,400 da Nm
